Question 1

Marked out of

Correct

1.00

Given an array of integers, reverse the given array in place using an index and loop rather than a built-in function.

Example

arr = [1, 3, 2, 4, 5]

Return the array [5, 4, 2, 3, 1] which is the reverse of the input array. Function Description

Complete the function reverseArray in the editor below.

reverseArray has the following parameter(s): int arr[n]: an array of integers

Return

int[n]: the array in reverse order

Constraints

0 < arr[i] < 100

Input Format For Custom Testing

The first line contains an integer, n, the number of elements in arr. Each line i of the n subsequent lines (where  $0 \le i < n$ ) contains an integer, arr[i].

Sample Case 0

Sample Input For Custom Testing

5

2

1 < n < 100

```
25
            int *a = malloc(5 * sizeof(int));
26
27 +
            for (int i = 0; i < 5; i++) {
28
                (a + i) = i + 1;
29
30
31
           return a;
32
33
34
35 - int" reverseArray(int arr_count, int "arr, int "result_count) {
    *result_count=arr_count;
36
37
    static int rev[100];
38
    int i, j=0;
39
   for (i=arr_count-1;i>=0;i--)
    rev[j++]=arr[i];
40
   return rev;
41
42
43
```

	Test	Expected	Got	
~	int arr[] = {1, 3, 2, 4, 5};	5	5	~
	int result_count;	4	4	
	<pre>int* result = reverseArray(5, arr, &amp;result_count);</pre>	2	2	
	for (int i = 0; i < result_count; i++)	3	3	
	printf("%d\n", "(result + i));	1	1	

Passed all tests! ✓

Question 2 Correct

Marked out of

P Rag question

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of *minLength* or more, and it can only make one cut at a time. Given the array *lengths[]* representing the desired lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is marked into lengths already, in the order given.

## Example

$$n = 3$$

lengths = [4, 3, 2]

minLength = 7

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to minLength = 7, the final cut can be made. Return "Possible".

## Example

$$n = 3$$

lengths = [4, 2, 3]

minLength = 7

The rod is initially sum(lengths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 = 6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2 cuts cannot be made, the answer is "Impossible".

## **Function Description**

37

else 20 (

```
Complete the 'cutThemAll' function below.
 2
 3
      * The function is expected to return a STRING.
 4
      * The function accepts following parameters:
 5
      * 1. LONG INTEGER ARRAY lengths
 6

    2. LONG INTEGER minLength

 7
      */
 8
 9
10 .
      * To return the string from the function, you should either do static allocation or dynamic allocation
11
12
13

    For example,

      " char" return string using static allocation() (
14 -
            static char s[] = "static allocation of string";
15
16
17
            return s:
     * }
18
19
       char* return string using dynamic allocation() {
20 .
            char* s = malloc(100 * sizeof(char));
21
22
            s = "dynamic allocation of string";
23
24
           return s:
25
     * }
26
27
28
    char* cutThemAll(int lengths count, long *lengths, long minLength) {
30
    int s=0:
    for(int i=0;i<lengths_count-1;i++){
31 +
32
        s+=*(lengths+i);
33
34 - if(s>=minLength){
35
        return "Possible":
36
```
